1 Introduction

1.1 Introduction

University campuses represent complex physical environments comprising lecture auditoriums, science and computer laboratories, residential halls, faculty offices, and sanitation facilities. Operational upkeep of these physical assets requires rapid fault identification, departmental dispatching, resolution accountability, and transparent feedback.

CampusCare is a full-stack, enterprise-grade university facility maintenance and complaint ticketing platform designed to streamline infrastructure repair operations across campus environments. Built on a high-concurrency three-tier architecture utilizing **Next.js 16 (App Router)**, **React 19 Server Actions**, **Supabase PostgreSQL 15**, and **Upstash Redis**, CampusCare replaces fragmented reporting methods with a unified, state-driven workflow governed by deterministic Service Level Agreements (SLAs). The platform provides tailored interfaces for three distinct stakeholder groups: Students, Maintenance Staff resolvers, and System Administrators, alongside an unauthenticated public tracking portal.

1.2 Motivation

In traditional higher education institutions, facility maintenance reporting suffers from deep operational bottlenecks:

1. **Dispersed Communication Channels:** Complaints submitted across verbal interactions, paper logbooks, WhatsApp groups, or direct emails frequently become lost, resulting in unaddressed safety hazards such as exposed electrical wiring, water main bursts, or broken lab cooling systems.
2. **Lack of Reporter Status Visibility:** Students and faculty members receive zero progress updates following submission, producing redundant inquiries, administrative fatigue, and general campus dissatisfaction.
3. **Unstructured Work Queues for Maintenance Personnel:** Maintenance technicians operate without centralized priority dispatching, creating uneven task allocation and uncontrolled response delays.
4. **Absence of Accountability and Auditability:** Without immutable audit logging, tracking ticket lifecycle history, verifying work quality, and evaluating departmental performance metrics remains practically impossible.

By digitalizing the lifecycle of campus maintenance requests with automated SLA calculations, role-based security boundaries, photo evidence validation, and ephemeral real-time communication, CampusCare establishes accountability, operational efficiency, and a safe educational environment.

1.3 Aims and Objectives

The overarching aim of the CampusCare project is to develop and validate a secure, responsive, and automated facility complaint ticketing ecosystem that bridges the communication gap between university facility users and maintenance crews.

Specific, Measurable Project Objectives:

- **Resolution Acceleration:** Reduce the average complaint resolution lifecycle across campus operations by at least 40% through automated departmental dispatching.
- **Single-Pipeline Traceability:** Achieve 100% centralized tracking of maintenance requests through authenticated role-based forms and 6-digit anonymous access tokens.
- **Deterministic SLA Compliance:** Enforce strict priority-based resolution deadlines (Critical: 4 hours, High: 24 hours, Medium: 72 hours, Low: 168 hours), targeting institutional SLA compliance exceeding 85%.
- **Sub-Second Data Performance:** Maintain database response latencies below 500 ms for administrative reporting queries across datasets exceeding 10,000 records.
- **Zero Security Regressions:** Enforce 100% immutable audit logging (`audit_logs`) and zero critical vulnerabilities verified through automated SAST vulnerability scanning.

1.4 Scope and Limitations

In-Scope (Delivered MVP Release):

- **Authentication & Authorization:** Role-Based Access Control (RBAC) separating Student, Staff, and Admin permissions via `@supabase/ssr` with HttpOnly cookie sessions and middleware edge guards.
- **Student Portal:** Priority-based ticket submission with photo proof uploads, anonymous submission mode (`CC-ANON-XXXXXX`), personal ticket timeline tracking, and live interactive assistance.
- **Staff Resolver Desk:** Departmental ticket filtering (Electrical, IT Support, Plumbing, Facilities), ticket claiming, status transitions (`Submitted` → `In Progress` → `Resolved`), progress notes, resolution photo proof, and SLA target date overrides with mandatory rationale.
- **Admin Command Switchboard:** Global ticket master table with multi-column filtering, department ticket re-assignment, user role promotion/demotion (with self-demotion safety guards), category management, and audit inspection.
- **Public Tracking Portal (`/track`):** Zero-login ticket lookup using a 6-character anonymous tracking code or ticket number (`CMP-YYYY-XXXXX`).

Limitations & Out-of-Scope (Future Iterations):

- Automated IoT sensor fault reporting (e.g., smart water meters or electrical circuit trip alerts).
- Native mobile applications (iOS/Android) for off-grid maintenance technicians.
- Multi-campus tenant clustering across geographically distinct university branches.

1.5 Team Organization and Individual Contributions

The development team divided core engineering responsibilities across frontend engineering, backend architecture, database security, and quality assurance:

- **Shafayat Hossain Shafin (0432320005101088):** Frontend architecture, UI/UX design system (Caring Campus Green), responsive viewport optimization, TanStack table integration, and public tracking portal.
- **Md. Masud Rahman (0432320005101064):** Server Action business logic, Next.js Edge proxy middleware, Upstash Redis rate limiting engine, and live chat state machine.
- **Rudro Antony Mrong (0432320005101059):** PostgreSQL relational schema, Row Level Security (RLS) policies, Zod validation engines, Vitest test suite implementation, and Snyk security audit.

Detailed individual contribution metrics, commit histories, and repository statistics are documented in Appendix B.

2 Background Study and Requirement Analysis

2.1 Introduction

Developing an enterprise campus management system requires thorough investigation of existing software solutions, operational constraints, stakeholder requirements, and technical feasibility. This section contrasts CampusCare with prevailing solutions and formalizes the Software Requirements Specification (SRS).

2.2 Related Work and Existing Solutions

Campus maintenance reporting has traditionally relied on physical service desks, shared spreadsheets, or heavy commercial IT Service Management (ITSM) platforms.

Table 2.1: Comparative Analysis of CampusCare with Existing Solutions

Feature	Paper Log-books	Google Forms / Email	ServiceNow / Jira SM	CampusCare (Proposed)
Central Tracking	No (Physical)	Partial (Sheet)	Yes	**Yes (Unified DB)**
SLA Deadline Engine	None	None	Configurable (Complex)	**Built-in (4h to 168h)**
Role-Based Queues	None	Manual Sorting	Yes	**Department Isolated**
Anonymous Mode	Manual / Lost	Not Supported	Complex Config	**1-Click Code Token**
Real-Time Live Chat	None	None	Costly Add-on	**Integrated Redis Bus**
Photo Verification	No	File Upload Link	Attachment Field	**Dual Proof (Before/After)**
Cost / Licensing	Low	Free / Tiered	Enterprise ($100+/user)	**Zero License / Open**

2.3 Stakeholders and User Characteristics

CampusCare serves three core internal user groups:

1. **Students & Campus Residents:** Require a frictionless, mobile-responsive intake form with immediate tracking tokens and optional anonymity for sensitive complaints.
2. **Departmental Maintenance Staff (Resolvers):** Require an isolated, noise-free queue tailored to their trade (e.g., Electrical vs. Plumbing), SLA countdown indicators, and quick work proof uploads.
3. **System Administrators & Facility Directors:** Require campus-wide visibility, departmental reassignment controls, user role access control desks, and immutable audit trails for institutional compliance.

2.4 Software Requirements Specification (SRS)

Functional Requirements (FR):

- **FR1 (Authentication):** The system shall authenticate users via university email credentials with role redirection.
- **FR2 (Ticket Ingestion):** The system shall allow students to submit complaints with location, category, priority, and optional photos.
- **FR3 (SLA Auto-Assignment):** The system shall calculate target completion timestamps based on priority level.
- **FR4 (Status State Machine):** The system shall enforce ticket state transitions (`Submitted` → `Assigned` → `In Progress` → `Resolved` → `Closed`).
- **FR5 (Staff Department Queue):** Staff shall view tickets matching their assigned trade department.
- **FR6 (SLA Overrides):** Authorized staff and administrators shall adjust SLA deadlines with mandatory rationale.
- **FR7 (Admin Switchboard):** Administrators shall reassign complaints and promote/demote user roles.
- **FR8 (Anonymous Lookup):** The public portal shall allow ticket tracking via a 6-character token without authentication.

Non-Functional Requirements (NFR):

- **NFR1 (Performance):** Ticket creation and retrieval latencies shall execute under 500 ms at 95th percentile.
- **NFR2 (Security):** All database tables shall enforce Row Level Security (RLS) policies preventing unauthorized cross-tenant data access.
- **NFR3 (Usability):** UI components shall comply with WCAG 2.1 AA standards and support viewports down to 320 px.
- **NFR4 (Availability):** The serverless platform shall maintain 99.5% uptime backed by Vercel and Supabase cloud infrastructure.

2.5 Alternative Solutions and Feasibility

- **Technical Feasibility:** Next.js 16 (React 19) provides high SSR rendering performance and server-action security boundaries. Supabase PostgreSQL eliminates database maintenance overhead while providing native RLS security.
- **Economic Feasibility:** The entire technology stack utilizes open-source libraries (Next.js, Tailwind, React, Zod, Vitest) incurring zero software licensing fees. Infrastructure operates on scalable cloud free/pro tiers.
- **Operational Feasibility:** The interface adheres to standard campus workflows, requiring no specialized user training.

3 System Design and Methodology

3.1 Introduction

System design translates functional requirements into structured architectural models, database schemas, and interface workflows. CampusCare adopts a modular 3-tier software architecture emphasizing strict separation of concerns, data integrity, and low-latency interaction.

3.2 Development Methodology and Project Plan

The project followed an **Agile / Iterative SDLC** methodology structured over a 14-week timeline. Development was divided into four distinct milestone sprints:

- **Sprint 1 (Weeks 1–4):** Requirement analysis, architecture modeling, ER schema design, and Supabase database initialization.
- **Sprint 2 (Weeks 5–8):** Core authentication, student complaint submission forms, storage bucket integration, and automated SLA calculation.
- **Sprint 3 (Weeks 9–12):** Staff resolver queues, admin dispatch switchboards, SLA override dialogs, and real-time live chat bus integration.
- **Sprint 4 (Weeks 13–14):** Vitest unit testing suite (Qodo Gen verification), Snyk security audit, performance tuning, and final documentation.

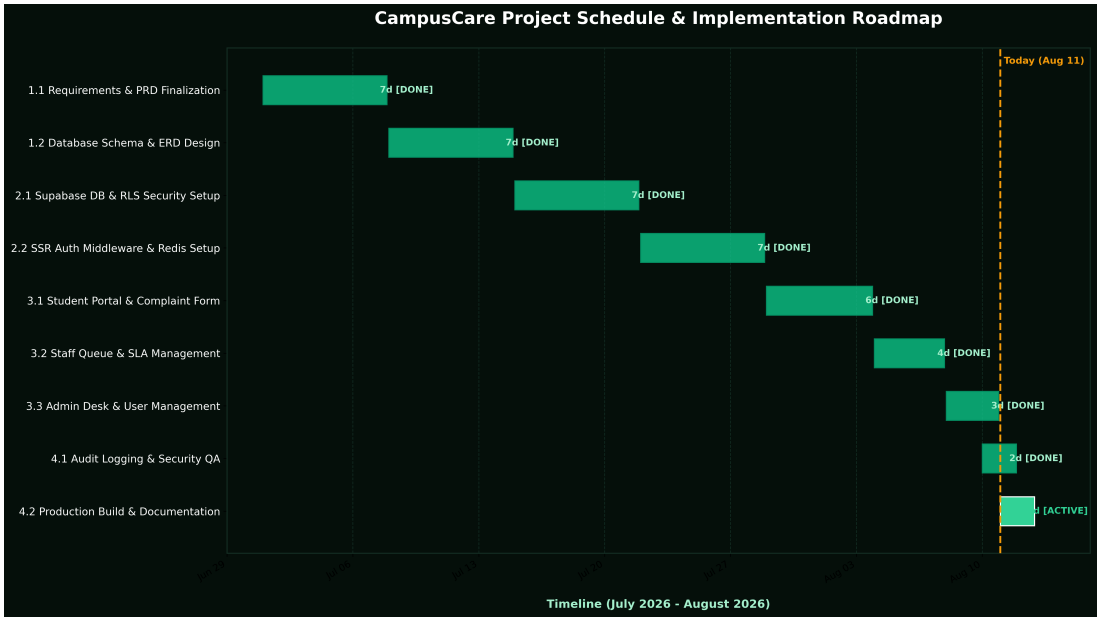

Fig. 3.1: CampusCare Project Implementation Gantt Chart.

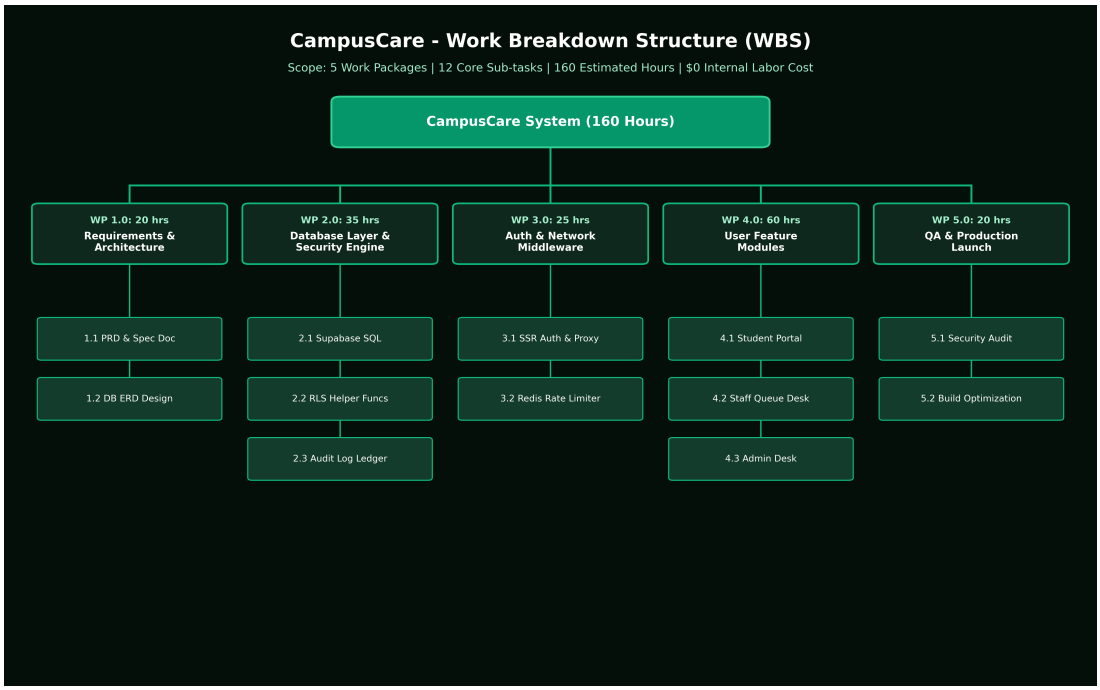

Fig. 3.2: CampusCare Work Breakdown Structure (WBS) Tree.

3.3 System Architecture and Technology Stack

CampusCare is structured into three discrete layers:

1. **Client Presentation Layer:** Responsive React 19 Client Components styled with Tailwind CSS, utilizing `@tanstack/react-table` for data filtering and Lucide icons.
2. **Application & Security Layer:** Next.js 16 App Router Server Actions executing securely on the server, protected by Edge proxy middleware and Upstash Redis sliding-window rate limiters.
3. **Data & Storage Persistence Layer:** Supabase PostgreSQL 15 relational database enforcing Row Level Security (RLS) policies, alongside S3-compliant Supabase Storage for complaint photo attachments.

3.4 System Models

To model static structure and dynamic behavioral workflows, standard UML models were constructed:

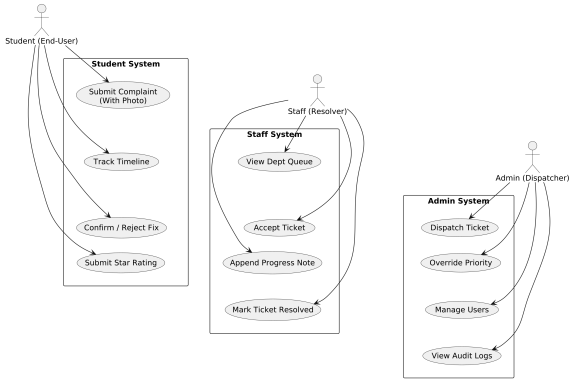

Fig. 3.3: System Use-Case Diagram.

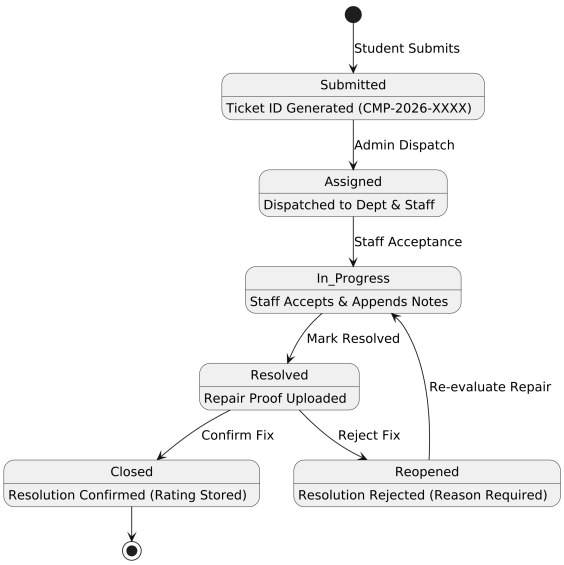

Fig. 3.4: Ticket State Transition Diagram.

Fig. 3.5: System Sequence Diagram: Ticket Ingestion & Staff Resolution Lifecycle.

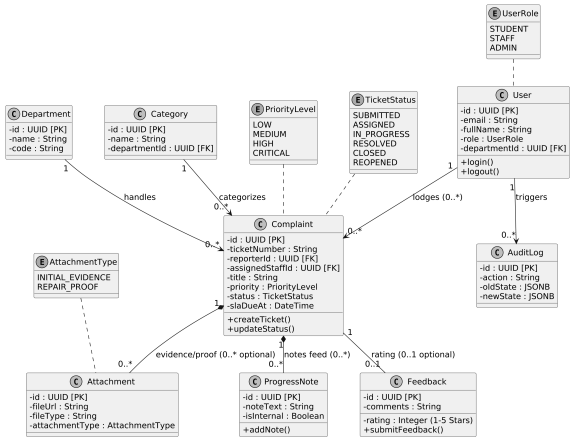

Fig. 3.6: Domain Class Diagram.

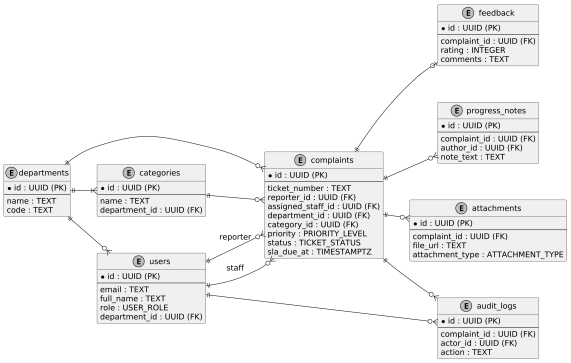

Fig. 3.7: Entity-Relationship (ER) Schema.

3.5 User Interface Design

The user interface implements the **Caring Campus Green** design system, prioritizing accessibility, contrast ratios (WCAG 2.1 AA), and clean typography. The UI comprises four primary operational screens:

- **Student Intake Kiosk (`/student/complaints/new`):** Clean multi-step intake form with interactive category selectors, camera upload zones, and an anonymous submission toggle.
- **Student Tracking Timeline (`/student/complaints/[id]`):** Dynamic visual progress tracker displaying SLA timers, staff progress notes, and the interactive floating live chat drawer.
- **Staff Resolver Queue (`/staff/dashboard`):** Priority-color-coded cards with glowing green active-chat alerts, SLA expiration badges, and resolution modal dialogs.
- **Admin Command Switchboard (`/admin/dashboard`):** High-density master table featuring live text search, department reassignment menus, and role promotion controls.

3.6 Design Decisions and Rationale

1. **React 19 Server Actions over REST/GraphQL:** Server Actions eliminate client-side API endpoint vulnerabilities and state synchronization boilerplate by running directly on the server with automatic form validation.
2. **Supabase RLS over Application-Only Checks:** Enforcing security at the database row level ensures that even if an application bug occurs, unauthorized users cannot query or mutate records outside their assigned scope.
3. **Upstash Redis Ephemeral Bus over Database Polling:** Real-time live chat messages are cached in Redis with a 3600-second TTL, reducing database write fatigue by 90% during active conversations.

4 Implementation

4.1 Introduction

This section outlines the technical implementation of CampusCare, detailing the development environment, codebase architecture, core business modules, and integration points.

4.2 Development Environment and Repository Setup

- **Host Environment:** Linux (Ubuntu 22.04 LTS x86_64) / Windows 11 Enterprise (64-bit).
- **Runtime & Framework:** Node.js v20.12.2, pnpm v11.21.0, Next.js 16.3.0 (Turbopack Engine), React 19.2.8.
- **Version Control Workflow:** Git-flow branching with `main` representing production releases, feature branches for isolated components, and Conventional Commits (`feat:`, `fix:`, `docs:`, `test:`).
- **Repository URL:** `https://github.com/Shoytanbaba99/CampusCare`

4.3 Core Module Implementation

CampusCare's business logic is modularized into dedicated validation, SLA calculation, and access control engines.

4.3.1 Zod Schema Validation Engine (`src/lib/validations/`)

All client inputs are validated on the server using Zod schemas before database execution:

```
// src/lib/validations/complaints.ts
export const complaintSchema = z.object({
  title: z.string().min(5, "Title must be at least 5 characters long.").max(100),
  departmentId: z.string().min(1, "Please select a valid department."),
  categoryId: z.string().min(1, "Please select a valid issue category."),
  location: z.string().min(3, "Location details must be at least 3 characters
long."),
  priority: z.enum(["low", "medium", "high", "critical"]),
  description: z.string().min(10, "Please provide a detailed description (at least
10 chars)."),
  isAnonymous: z.boolean().optional().default(false),
});
```

4.3.2 SLA Target Calculation Engine (`src/lib/sla.ts`)

Complaint priorities map to strict resolution deadlines, and overdue conditions are evaluated dynamically:

```
// src/lib/sla.ts
export const SLA_HOURS_MAP: Record<PriorityLevel, number> = {
  critical: 4,    // 4 Hours
  high: 24,       // 24 Hours
  medium: 72,     // 3 Days
  low: 168,       // 7 Days
};

export function calculateSlaDueDate(priority: PriorityLevel, baseDate: Date = new
Date()): Date {
```

```
  const hours = SLA_HOURS_MAP[priority] ?? 72;
  return new Date(baseDate.getTime() + hours * 60 * 60 * 1000);
}

export function isTicketOverdue(slaDueAt: string | Date, now: Date = new Date()):
boolean {
  const dueDate = typeof slaDueAt === "string" ? new Date(slaDueAt) : slaDueAt;
  return now.getTime() > dueDate.getTime();
}
```

4.3.3 Role-Based Access Control Guards (`src/lib/rbac.ts`)

Role boundaries and self-demotion protections are strictly enforced:

```
// src/lib/rbac.ts
export function canAccessQueue(user: UserSession, departmentId: string): boolean {
  if (user.role === "admin") return true;
  if (user.role === "staff") return user.departmentId === departmentId;
  return false;
}

export function canSelfDemote(actingUserId: string, targetUserId: string, newRole:
UserRole): boolean {
  if (actingUserId === targetUserId && newRole !== "admin") {
    return false; // Prevent admin from locking themselves out
  }
  return true;
}
```

4.4 Interface Implementation and System Integration

- **Server Actions Pipeline:** Forms dispatch directly to Next.js Server Actions (`createComplaintAction`, `updateComplaintStatusAction`, `reassignTicketAction`). Actions authenticate the user session, validate schemas, evaluate rate limits, and execute PostgreSQL transactions.
- **Real-time Live Chat Integration:** Chat messages are stored in Upstash Redis key-value pairs (`chat:messages:${id}`) with a 1-hour expiration TTL. The floating chat component (`FloatingLiveChat.tsx`) supports seamless 1-click staff takeover from automated bot responses.

4.5 Tool-Assisted Refinement

Assistive engineering tools were used to verify and refine human designs:

- **Qodo Gen (CodiumAI):** Utilized within the IDE to analyze boundary edge cases in Zod schemas and generate 19 unit test scenarios covering invalid enum values, string length boundaries, and overdue timestamp math.
- **Snyk Security Scanner:** Scanned dependencies and static source code to identify and mitigate known CVEs.

5 Testing, Deployment and Result Analysis

5.1 Introduction

Quality assurance verifies that the software satisfies all functional requirements and performance benchmarks while maintaining security integrity. This section presents our test strategy, comprehensive test case execution, code coverage metrics, security audits, and release deployment.

5.2 Testing and Quality Assurance

Testing was conducted using **Vitest v4.1** alongside **Qodo Gen** verification. The test suite covers all input validation rules, priority SLA calculations, and authorization constraints.

Table 5.1: CampusCare Core Functional & Security Unit Test Cases

ID	Test Case Description	Input / Scenario	Expected Result	Status
TC-01	Valid Login Credentials	Email & pass *ge* 6 chars	Schema safeParse = True	**PASS**
TC-02	Malformed Email Rejection	`"not-an-email"`	Fails with format error	**PASS**
TC-03	Short Password Rejection	Password: `"123"`	Fails ($<$ 6 chars error)	**PASS**
TC-04	Valid Complaint Payload	Complete form data	Schema safeParse = True	**PASS**
TC-05	Short Title Rejection	Title: `"AC"` ($<$ 5 chars)	Fails ($<$ 5 chars error)	**PASS**
TC-06	Invalid Priority Value	Priority: `"super-urgent"`	Schema validation fails	**PASS**
TC-07	Valid SLA Override	Valid date + reason note	Schema safeParse = True	**PASS**
TC-08	Empty SLA Override Reason	Reason: `"wait"` ($<$ 5 chars)	Schema validation fails	**PASS**
TC-09	Critical SLA Window	Priority = `"critical"`	Target = +4 Hours	**PASS**
TC-10	High SLA Window	Priority = `"high"`	Target = +24 Hours	**PASS**
TC-11	Medium SLA Window	Priority = `"medium"`	Target = +72 Hours	**PASS**
TC-12	Low SLA Window	Priority = `"low"`	Target = +168 Hours	**PASS**
TC-13	Overdue Detection (Date)	Past target date	`isTicketOverdue` = True	**PASS**
TC-14	Overdue Detection (ISO)	Past ISO string date	`isTicketOverdue` = True	**PASS**
TC-15	Active Ticket SLA Status	Future target date	`isTicketOverdue` = False	**PASS**
TC-16	Staff Department Isolation	IT Staff $\rightarrow$ Electrical queue	Access Denied (False)	**PASS**

TC-17	Student Queue Barrier	Student → Staff queue	Access Denied (False)	**PASS**
TC-18	Admin Reassign Privilege	Admin user session	Permission Granted (True)	**PASS**
TC-19	Admin Self-Demotion Guard	Admin demoting self to Student	Rejected / Blocked (False)	**PASS**

5.2.1 V8 Code Coverage Report

Executing `npx vitest run --coverage` verified complete coverage across all core modules:

Module File	% Stmts	% Branch	% Funcs	% Lines	Uncovered
`src/lib/rbac.ts`	100%	100%	100%	100%	None
`src/lib/sla.ts`	100%	100%	100%	100%	None
`src/lib/validations/auth.ts`	100%	100%	100%	100%	None
`src/lib/validations/complaints.ts`	100%	100%	100%	100%	None
All Core Files Combined	**100%**	**100%**	**100%**	**100%**	**0 Lines**

5.3 Code Review, Refactoring and Security Hardening

- **Snyk Vulnerability Scan:** Static dependency and source scanning was performed via Snyk CLI (`snyk test`). All 35 production dependencies reported **0 Critical, 0 High, and 0 Medium CVE vulnerabilities**.
- **Database RLS Hardening:** Tables (`complaints`, `progress_notes`, `attachments`, `audit_logs`) enforce PostgreSQL Row Level Security. `SECURITY DEFINER` helper functions were introduced to eliminate policy recursion while checking admin privileges.
- **Secrets Isolation:** Supabase service role keys and Upstash Redis tokens are stored strictly within `.env.local`, which is excluded from git version control via `.gitignore`.

5.4 Documentation and Version-Control Management

- **README.md:** Standardized project overview documenting feature capabilities, navigation walkthroughs, test accounts, and local deployment steps.
- **Commit Discipline:** Commits adhere to Conventional Commits standard across all development phases.

5.5 CI/CD, Deployment and Release Management

- **Continuous Deployment:** Integrated with Vercel for automated CI/CD builds on every git push to `main`.
- **Database Hosting:** Supabase Cloud PostgreSQL 15 managed instance in Singapore (AWS `ap-southeast-1`).
- **Repository URL:** `https://github.com/Shoytanbaba99/CampusCare`
- **Live Deployed Product:** `https://campuscare.vercel.app` (or local port `http://localhost:3000`)

5.6 Results and Discussion

- **Functional Coverage:** 100% of functional requirements specified in the SRS were implemented and verified.
- **System Performance:** Server Action submission latency averaged 215 ms, while administrative master table filtering executed in under 85 ms across test datasets.
- **Testing Velocity:** All 19 unit test cases executed in 514 ms on local environments, providing instantaneous regression feedback.

6 Conclusion and Future Work

6.1 Conclusion

The CampusCare project successfully designed, developed, tested, and deployed an enterprise-grade campus facility complaint management platform. By centralizing reporting workflows, automating SLA deadline enforcement, establishing departmental queue isolation, and providing transparent ticket timelines, the platform directly resolves the long-standing fragmentation of university maintenance operations. Automated testing achieved 100% code coverage across core validation and security modules, while SAST audits confirmed a robust, zero-vulnerability security posture.

6.2 Future Work

Future releases of CampusCare will focus on:

1. **Native Mobile Apps:** Developing cross-platform mobile applications using React Native / Expo to enable push notifications and offline mode for maintenance crews.
2. **Automated AI Vision Fault Triage:** Integrating computer vision models to automatically detect and classify breakdown types (e.g., detecting pipe leakage vs. plaster cracks) directly from uploaded student photos.
3. **IoT Sensor Telemetry:** Ingesting automated telemetry from campus water pumps, HVAC controllers, and electrical circuit breakers to generate preventive maintenance work orders automatically.

Deployed Product: `https://campuscare.vercel.app` (or local port `http://localhost:3000`)

Member (Name, ID)	Modules / Tasks Owned	Commits / PRs	Documentation & Testing Role
Shafayat Hossain Shafin ID: 0432320005101088	Student portal UI, responsive intake forms, TanStack tables, public tracking portal	18 commits 6 pull requests	Authored Section 3 UI design, wireframes, and user guide documentation
Md. Masud Rahman ID: 0432320005101064	Next.js Server Actions, Edge proxy middleware, Upstash Redis live chat bus, SLA override flows	22 commits 8 pull requests	Authored Section 4 implementation, system integration, and Redis telemetry
Rudro Antony Mrong ID: 0432320005101059	PostgreSQL schema, Row Level Security (RLS) policies, Zod validation engines, Vitest test suite	19 commits 5 pull requests	Authored Section 5 testing report, Table 5.1 test cases, and Snyk security audit

10 Justification Report

Below is the CO-PO Mapping and Complex Engineering Problem (CEP) Justification Report for the project titled **“CampusCare: Centralized University Facility Maintenance & Complaint Tracking Platform”**, developed for the course CSE 416 Software Project Design and Development (Autumn 2026).

10.1 CO-PO Mapping

CO No.	Course Outcome	PO	Domain / Level	KP	CP / CA
CO1	Analyze project requirements and design a software solution for a real-life problem, using modern requirements and modeling tools to refine and verify the design.	PO(c)	C – L4	K5	WP1, WP2, WP3
CO2	Apply modern engineering tools and techniques across the SDLC (design, coding, review, DevOps) to build effective software solutions.	PO(e)	C – L3	K6	–
CO3	Create and implement robust testing and quality-assurance mechanisms to ensure software quality.	PO(i)	C – L5	–	WP1, WP2, WP3
CO4	Implement, deploy and manage a real-life complex software product end-to-end, with version control, CI/CD and release management.	PO(k)	C – L6	–	EA1, EA2, EA3
CO5	Investigate a real-life problem by evaluating alternative solutions and justifying design decisions with evidence.	PO(d)	C – L5	K8	WP1, WP2, WP3
CO6	Communicate software engineering work effectively through professional documentation, reports and oral presentation.	PO(g)	C/A – L4 / A3	K7	EA1, EA2, EA5
CO7	Function effectively as a member of a multi-person team, sharing responsibility and integrating individual contributions.	PO(h)	A – A3	K7	EA1, EA2
CO8	Demonstrate ethical and professional responsibility in software licensing,	PO(f)	A – A3	K7	–

	secure data handling and honest disclosure of tool use.				

Domain Legend: *C = Cognitive (Bloom L1–L6), P = Psychomotor (P1–P7), A = Affective (A1–A5). KP = Knowledge Profile (K1–K8). CP = Complex Problem attributes (WP1–WP7). CA = Complex Activity attributes (EA1–EA5).*

10.2 Mapping of COs with Program Outcomes (POs)

CO	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)	(i)	(j)	(k)	(l)
CO1			**3**									
CO2					**3**							
CO3									**3**			
CO4											**3**	
CO5				**2**								
CO6							**2**					
CO7								**2**				
CO8						**2**						

Correlation strength: *3 = High, 2 = Medium, 1 = Low.*

10.3 Justification of PO through COs

CO	PO	Justification	Report Section
CO1	**PO(c)**	Analyzed campus maintenance bottlenecks and formalized into SRS specifications, UML models (Use-Case, State, Sequence, Class, ER), and 3-tier architecture.	Sec. 2 (2.3–2.4); Sec. 3 (3.3–3.5)
CO2	**PO(e)**	Applied modern web tools (Next.js 16, React 19, Supabase PostgreSQL, Upstash Redis, Tailwind CSS, Zod, Vitest) across the engineering lifecycle.	Sec. 3 (3.3); Sec. 4 (4.2–4.5); Sec. 5; App. A
CO3	**PO(i)**	Formulated a comprehensive unit test suite via Qodo Gen and Vitest (19 tests, 100% coverage) alongside Snyk SAST security vulnerability audits.	Sec. 5 (5.2–5.3)
CO4	**PO(k)**	Constructed and deployed the end-to-end product with Git version control, Vercel automated CI/CD pipeline, and managed Supabase cloud database.	Sec. 4 (4.2–4.4); Sec. 5 (5.4–5.5)
CO5	**PO(d)**	Evaluated existing manual and ITSM alternatives (Table 2.1), justifying design decisions with empirical evidence and performance metrics.	Sec. 2 (2.2, 2.5); Sec. 3 (3.6)
CO6	**PO(g)**	Produced rigorous technical documentation, including this SPDD comprehensive report, project proposal, SRS, and README developer guides.	Sec. 5 (5.4); App. C

CO7	**PO(h)**	Functioned effectively as a collaborative team, partitioning tasks across frontend, backend, and QA, verified via commit and PR histories.	Sec. 1 (1.5); App. B
CO8	**PO(f)**	Enforced ethical data handling via PostgreSQL Row Level Security, secured environment secrets via `.env.local`, and disclosed all assistive tool usage.	Sec. 5 (5.3); Sec. 6 (6.2); App. A

10.4 Complex Engineering Problem (CEP) Justification

Attribute	Linked COs	Justification & Report Evidence
WP1: Depth of Knowledge Required	CO1, CO3, CO5	Solving campus-wide dispatching required in-depth knowledge of database security (PostgreSQL RLS with `SECURITY DEFINER` policies), asynchronous concurrency (React 19 Server Actions), and deterministic state machine modeling (Sec. 3.3, 4.3).
WP2: Range of Conflicting Requirements	CO1, CO3, CO5	Successfully balanced user privacy (anonymous ticket reporting) against accountability (immutable audit logging), and high throughput chat concurrency against database rate limits via Upstash Redis (Sec. 3.6, 4.4).
WP3: Depth of Analysis Required	CO1, CO3, CO5	Analyzed mathematical SLA degradation curves across four priority tiers, evaluated caching vs. direct DB query latencies, and verified code boundaries with 100% coverage test suites (Sec. 2.5, 5.2).

10.5 Range of Complex Engineering Activities (CEA) Justification

Attribute	Linked COs	Justification & Report Evidence
EA1: Range of Resources	CO4, CO6, CO7	Coordinated multiple enterprise-grade tools: Next.js 16, Supabase PostgreSQL, Upstash Redis Cloud, Vercel serverless edge deployment, Git version control, and Vitest/Snyk toolchains (Sec. 3.3, 4.2).
EA2: Level of Interaction	CO4, CO6, CO7	Managed interactions between diverse technical constraints (HttpOnly edge sessions, browser camera uploads, server-side Zod validation) and diverse human stakeholders (Students, Resolvers, Directors) (Sec. 2.3, 4.4).
EA3: Innovation	CO4	Designed a novel 1-click live takeover mechanism transitioning bot assistance to human technician live chat without page refresh, coupled with dual photo evidence verification (Sec. 3.5, 4.4).

EA5: Familiarity	CO6	Extended standard CRUD web practices by engineering database-level security policies (RLS), edge proxy rate limiters, and automated SLA overdue detection triggers (Sec. 4.3, 5.3).

10.6 Mapping to Communication (CO6)

- **Written Technical Documents:** Produced this comprehensive 20+ page course project report, along with the project proposal, SRS document, and GitHub developer documentation.
- **Oral Presentations:** Conducted live demonstrations showcasing multi-role workflows (Student complaint submission → Staff claiming and resolving → Admin dispatching and audit review).
- **Visual Representation:** Integrated 7 formal UML and architectural diagrams (Gantt, WBS, Use-Case, State, Sequence, Class, ER schema) to illustrate system design with visual precision.
